**MOSQUITO BATCHES COLLECTED IN RYE BROOK & MT. VERNON  
TESTS POSITIVE FOR WEST NILE VIRUS  
No Spraying Planned**

The Westchester County Health Department has learned that two mosquito batches submitted for testing to the New York State Health Department have tested positive for West Nile Virus. One batch was collected in Rye Brook on July 30 and the other batch was collected in Mt. Vernon on August 5. This brings the total number of positive mosquito batches in Westchester to three for this year, with no reported human cases of West Nile Virus thus far.

The Health Department will continue with mosquito surveillance efforts throughout the county, as well as in the areas where these two positive mosquito batches were found. Efforts will include mosquito trapping and testing as well as surveying catch basins for mosquito larvae or standing water. No spraying is planned at this time.

Health Commissioner Dr. Joshua Lipsman said that these findings are not unexpected and serve as a reminder that residents should protect themselves against mosquito bites.

“It is particularly important that residents remain vigilant in their efforts to reduce their risk of West Nile virus, particularly now, during peak mosquito season,” said Dr. Lipsman.

The Health Department recommends that residents take the following precautions:

- Avoid being outdoors in the late afternoon and early evening when mosquitoes are active and feeding.
- Use insect repellents with no more than 30% DEET (N, N-diethyl-meta-toluamide) when outdoors in such areas at those times. Products containing DEET are not recommended for use on children under 2 months of age. Insect repellents should be used especially at dusk and evening hours when mosquitoes are most likely to bite. Be sure to read and follow the manufacturer’s directions for use.

**WNV POSITIVE MOSQUITO POOL P.2**

- Wear protective clothing such as long pants, long-sleeved shirts, and socks when outdoors in areas and at times where and when mosquitoes are active and feeding.

“It is also important that residents do their part to reduce potential mosquito breeding sites around their homes,” Dr. Lipsman said. “Mosquitoes capable of carrying West Nile virus lay their eggs in stagnant water. The eggs can develop in any pool or puddle of untreated water that stands undisturbed for more than four days,” he warned. The Health Department recommends doing the following around your home:

- Rid your property of tin cans, plastic containers, ceramic pots or similar water-holding containers
- Remove discarded tires
- Drill holes in the bottoms of all recycling containers that are left outdoors
- Turn over plastic wading pools, buckets and wheelbarrows when not in use
- Change the water in birdbaths at least twice weekly
- Sweep your driveway after it rains so that it is free of puddles
- Keep storm drains and gutters clear of leaves and debris
- Clean and chlorinate swimming pools, outdoor spas and hot tubs and drain water that collects on their covers.

Under County Executive Andy Spano's mosquito control program, *Operation Mosquito S.T.I.N.G.* (Stop The Insect's Next Generation), the County has applied larvicide to catch basins countywide to kill immature mosquitoes. Residents who notice large areas of standing water that could serve as potential mosquito breeding grounds should report this information to the Health Department by calling (914) 813-5000 or online through its Internet site, [www.westchestergov.com/health](http://www.westchestergov.com/health). Residents may also keep current with research on alternative insect repellents by visiting the Centers for Disease Control & Prevention's website at [www.cdc.gov](http://www.cdc.gov).
